Medical Devices (/Clinical-and-Diagnostics)

An interdisciplinary team of researchers from Washington University School of Medicine in St. Louis and the School of Engineering & Applied Science is redefining the notion of a wisdom tooth.

White Papers (/medical/whitepapers)

The team is developing a smart-tooth technology that could someday be used to detect early signs of certain diseases in high-risk patients by analyzing saliva or gingival crevicular fluid.

Health & Personal Care (/Consumer-Products)

"Salivary-based biosensors have generated a lot of interest because of their potential for wide applications in medicine," said Eric Jaym Scheller, who trained as a dentist and is now an assistant professor of medicine and of cell biology and physiology in the School of Medicine. "We're initially working to develop a biological sensor that measures specific peptides active in periodontal disease and that would be used in combination with a wireless device to retrieve that data."

Contact (/medical/contact)

Meet the Team (/medical/team)

"It's like an electronic tooth," said Shantanu Chakrabarty, professor of electrical & systems engineering in the School of Engineering & Applied Science and a partner on

Search (/medical/search)

By the project, currently funded by a four-year, \$1.5 million grant from the National Institutes of Health. **Find out more (/privacy#cookies).**

That electronic tooth is actually a tiny sensor and an electronic chip, about a few millimeters-cube in volume. It is designed to be inserted inside the patient's gum line or as part of a dental appliance, and contains recognition elements that measure disease-specific peptides, which are natural or synthetic groups of amino acids. As a first attempt, the research team will work toward monitoring peptides related to bone

breakdown during periodontitis, a dental disease that can lead to loosening and loss of teeth. A wireless ultrasound device would then be used to read the peptide levels and connect to the medical data cloud.

White Papers (/medical/whitepapers)

Right now, one of the project's biggest challenges is chemistry. [MediKnowledge \(/mediknowledge\)](#)

"You only have a finite number of of bio-recognition elements conjugated to the transducer if you are using an antibody that is specific to these peptides," said Srikanth Singamaneni, associate professor of mechanical engineering & materials science. "They get saturated fairly quickly. The question is how do you refresh those sensors? That's one of the aspects we are working to address with this project." [Newsletters \(/medical/newsletters\)](#) [Health & Personal Care \(/Consumer-Products\)](#) [Twitter Channels \(/medical/twitter-channels\)](#)

The research team says developing a non-invasive system that can detect and monitor gum disease and the effectiveness of treatment would be beneficial to the 64 million U.S. residents with periodontal disease and to their dentists. The researchers also are interested in developing other applications for the technology that, while likely years away, could go well beyond the dentist's chair.
